74AHC123 Dual Retriggerable Monostable Multivibrator with Reset

GENERAL DESCRIPTION

The 74AHC123 is a high-speed silicon-gate CMOS device. The device is a dual retriggerable monostable multivibrator designed for 2.0V to 5.5V $V_{\rm CC}$ operation.

The 74AHC123 edge-triggered multivibrator features with output pulse width control by three methods. In the first method, the $n\overline{A}$ input is low, and the nB input goes high. In the second method, the nB input is high, and the $n\overline{A}$ input goes low. In the third method, the $n\overline{A}$ input is low, the nB input is high, and the $n\overline{R}D$ input goes high.

Once triggered, the basic output pulse width may be extended by retriggering the gated active low-going edge ($n\overline{A}$) input or the active high-going edge (nB) input. By repeating this process, the output pulse period (nQ = high, $n\overline{Q}$ = low) can be made as long as desired. Alternatively an output delay can be terminated at any time by a low-going edge on $n\overline{R}D$ input, which also inhibits the triggering.

An internal connection from $n\bar{R}D$ to the input gate makes it possible to trigger the circuit by a high-going signal at $n\bar{R}D$ input as shown in function table. Figure 3 and Figure 4 illustrate pulse control by retriggering and early reset.

The output pulse duration is programmed by selecting external resistance (R_{EXT}) and capacitance (C_{EXT}) values.

When $C_{\text{EXT}} \geq 10\text{nF}$, the typical output pulse width is defined as: $t_{\text{W}} = R_{\text{EXT}} \times C_{\text{EXT}}$ where $t_{\text{W}} = \text{pulse}$ width in ns; $R_{\text{EXT}} = \text{external}$ resistor in k Ω ; $C_{\text{EXT}} = \text{external}$ capacitor in pF. Schmitt-trigger action at all inputs makes the circuit highly tolerant to slower input rise and fall times.

FEATURES

- All Inputs Have a Schmitt-Trigger Action
- Inputs Accept Voltages Higher than V_{CC}
- Edge-Triggered from Active High or Active Low Gated Logic Inputs
- Retriggerable for Very Long Pulses up to 100% Duty Factor
- Direct Reset Terminates Output Pulse
- Operates with CMOS Input Levels
- -40°C to +125°C Operating Temperature Range
- Available in a Green SOIC-16 Package

FUNCTION TABLE

NOTES:

- 1. t_{PD} is the same as t_{PLH} and t_{PHL} .
- 2. For $C_{EXT} \ge 10$ nF, the typical value of the pulse width t_W (µs) = C_{EXT} (nF) × R_{EXT} (k Ω).
- 3. C_{PD} is used to determine the dynamic power dissipation (PD in μW).

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \Sigma (C_L \times V_{CC}^2 \times f_o)$$

where:

 f_i = input frequency in MHz.

 f_o = output frequency in MHz.

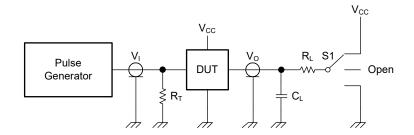

C_L = output load capacitance in pF.

 V_{CC} = supply voltage in Volts.

 $\Sigma(C_L \times V_{CC}^2 \times f_o) = Sum of outputs.$

Definitions test circuit:

R_L = Load resistance.

 C_L = Load capacitance including jig and probe capacitance.

 R_T = Termination resistance should be equal to output impedance Z_0 of the pulse generator.

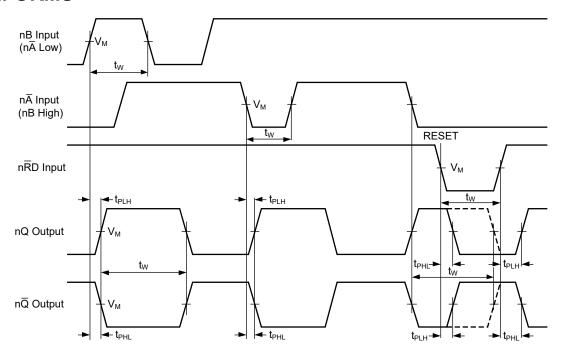

S1 = Test selection switch.
