

SGM8261-1/SGM8261-2

High-Performance, Bipolar-Input, Ultra Low Noise Operational Amplifiers

GENERAL DESCRIPTION

The SGM8261-1 (single) and SGM8261-2 (dual) bipolar-input operational amplifiers achieve very low noise density with an ultra low distortion of 0.00002% at 1kHz. The SGM8261-1/2 offer rail-to-rail output swing to within 185mV of supply rails with a 2k Ω load, which increases headroom and maximizes dynamic range. The devices also have a high output drive capability of ± 65 mA.

The devices operate over a wide supply range of 3.6V to 36V or ± 1.8 V to ± 18 V, on only 3.8mA of supply current per amplifier. The SGM8261-1/2 operational amplifiers are unity-gain stable and provide excellent dynamic behavior over a wide range of load conditions.

The SGM8261-1 is available in a Green SOIC-8 package. The SGM8261-2 is available in Green SOIC-8, MSOP-8 and TDFN-3 \times 3-8BL packages. They operate over an ambient temperature range of -40 $^{\circ}$ C to +85 $^{\circ}$ C.

FEATURES

- **Superior Sound Quality**
- **Low Offset Voltage: $\pm 350\mu$ V (MAX)**
- **Ultra Low Noise: 1.6nV/ $\sqrt{\text{Hz}}$ at 1kHz**
- **Ultra Low Distortion: 0.00002% at 1kHz**
- **High Slew Rate: 16V/ μ s**
- **Gain-Bandwidth Product: 16MHz (G = +1)**
- **High Open-Loop Gain: 140dB**
- **Unity-Gain Stable**
- **Low Quiescent Current: 3.8mA/Amplifier**
- **Rail-to-Rail Output**
- **Support Single or Dual Power Supplies:
3.6V to 36V or ± 1.8 V to ± 18 V**
- **-40 $^{\circ}$ C to +85 $^{\circ}$ C Operating Temperature Range**
- **Small Packaging:
SGM8261-1 Available in a Green SOIC-8 Package
SGM8261-2 Available in Green SOIC-8, MSOP-8
and TDFN-3 \times 3-8BL Packages**

APPLICATIONS

Professional Audio Equipment
Analog and Digital Mixing Consoles
High-End A/V Receivers

PACKAGE/ORDERING INFORMATION

MODEL	PACKAGE DESCRIPTION	SPECIFIED TEMPERATURE RANGE	ORDERING NUMBER	PACKAGE MARKING	PACKING OPTION
SGM8261-1	SOIC-8	-40°C to +85°C	SGM8261-1YS8G/TR	SGM 82611YS8 XXXXXX	Tape and Reel, 2500

MARKING INFORMATION

NOTE: XXXXX = Date Code and Vendor Code.

XXXXX

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

ABSOLUTE MAXIMUM RATINGS

- Supply Voltage, +V_S to -V_S 40V
- Input Voltage Range (-V_S) - 0.3V to (+V_S) + 0.3V
- Input Current (All pins except power supply pins)..... ±10mA
- Output Short-Circuit Current ±100mA
- Junction Temperature +150°C
- Storage Temperature Range -65°C to +150°C
- Lead Temperature (Soldering, 10s) +260°C
- ESD Susceptibility
- HBM 8000V
- MM 300V
- CDM 1000V

RECOMMENDED OPERATING CONDITIONS

- Operating Temperature Range -40°C to +85°C

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods

may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

PIN CONFIGURATIONS

NOTE:

For the TDFN-3x3-8BL package, connect thermal die pad to -Vs. Soldering the thermal pad improves heat dissipation and provides specified performance.

ELECTRICAL CHARACTERISTICS

(At $T_A = +25^\circ\text{C}$, $V_S = 4.5\text{V}$ to 36V or $V_S = \pm 2.25\text{V}$ to $\pm 18\text{V}$, $R_L = 2\text{k}\Omega$, $V_{CM} = V_{OUT} = V_S/2$, unless otherwise noted.)

At $T_A = +25^\circ\text{C}$, $V_S = \pm 15\text{V}$ and $R_L = 2\text{k}\Omega$, unless otherwise noted.

TYPICAL PERFORMANCE CHARACTERISTICS (continued)

At $T_A = +25^\circ\text{C}$, $V_S = \pm 15\text{V}$ and $R_L = 2\text{k}\Omega$, unless otherwise noted.

APPLICATION INFORMATION

The SGM8261-1/2 are unity-gain stable, precision operational amplifiers with very low noise; the devices are also free from output phase reversal. Applications with noisy or high-impedance power supplies require decoupling capacitors close to the device power supply pins. In most cases, 0.1µF capacitors are adequate.

Operating Voltage

The SGM8261-1/2 operational amplifiers operate from 4.5V to 36V or ±2.25V to ±18V supplies while maintaining excellent performance. However, some applications do not require equal positive and negative output voltage swing. With the SGM8261-1/2, power supply voltages do not need to be equal. For example, the positive supply could be set to 25V with the negative supply at -5V. In all cases, the input common mode voltage must be maintained within the specified range. In addition, key parameters are assured over the specified temperature range of T_A = -40°C to +85°C.

Input Protection

The input terminals of the SGM8261-1/2 are protected from excessive differential voltage with back-to-back diodes, as Figure 1 illustrates. In most circuit applications, the input protection circuitry has no consequence. However, in low-gain or G = +1 circuits, fast ramping input signals can forward bias these diodes because the output of the amplifier cannot respond rapidly enough to the input ramp. If the input signal is fast enough to create this forward bias condition, the input signal current must be limited to 10mA or less. If the input signal current is not inherently limited, an input series resistor (R_i) and/or a feedback resistor (R_f) can be used to limit the signal input current. This input series resistor degrades the low-noise performance of the SGM8261-1/2 and is examined in the following Noise Performance section. Figure 1 shows an example configuration when both current-limit input and feedback resistors are used.

Figure 1. Input Current Limit

Noise Performance

Equation 1 shows the total circuit noise for varying source impedances with the operational amplifier in a unity-gain configuration (Figure 2, no feedback resistor network, and therefore no additional noise contributions).

The SGM8261-1/2 (GBP = 16MHz, G = +1) is shown with total circuit noise calculated. The operational amplifier itself contributes both a voltage noise component and a current noise component. The voltage noise is commonly modeled as a time-varying component of the offset voltage. The current noise is modeled as the time-varying component of the input bias current and reacts with the source resistance to create a voltage component of noise. Therefore, the lowest noise operational amplifier for a given application depends on the source impedance. For low source impedance, current noise is negligible, and voltage noise generally dominates. The low voltage noise of the SGM8261-1/2 operational amplifiers makes them good choices for use in applications where the source impedance is less than 1kΩ.

The following equation shows the calculation of the total circuit noise:

$$E_o^2 = e_n^2 + (i_n R_s)^2 + 4kTR_s \tag{1}$$

Where e_n = voltage noise, i_n = current noise, R_s = source impedance, k = Boltzmann's constant = 1.38 × 10⁻²³ J/K, T = temperature in degrees Kelvin (K).

Figure 2. Unity-Gain Buffer Configuration

APPLICATION INFORMATION (continued)

Basic Noise Calculations

Design of low-noise operational amplifier circuits requires careful consideration of a variety of possible noise contributors: noise from the signal source, noise generated in the operational amplifier and noise from the feedback network resistors. The total noise of the circuit is the root-sum-square combination of all noise components.

The resistive portion of the source impedance produces thermal noise proportional to the square root of the resistance. The source impedance is usually fixed; consequently, select the operational amplifier and the

feedback resistors to minimize the respective contributions to the total noise.

Figure 3 illustrates both inverting and non-inverting operational amplifier circuit configurations with gain. In circuit configurations with gain, the feedback network resistors also contribute noise.

The current noise of the operational amplifier reacts with the feedback resistors to create additional noise components. The feedback resistor values can generally be chosen to make these noise sources negligible. The equations for total noise are shown for both configurations.

Noise in Non-Inverting Gain Configuration

Noise in Inverting Gain Configuration

Noise at the output:

$$E_o^2 = \left[1 + \frac{R_2}{R_1} \right]^2 e_n^2 + e_1^2 + e_2^2 + (i_n R_2)^2 + e_s^2 + (i_n R_S)^2 \left[1 + \frac{R_2}{R_1} \right]^2$$

Where $e_s = \sqrt{4kTR_S} \times \left[1 + \frac{R_2}{R_1} \right]$ = thermal noise of R_S

$$e_1 = \sqrt{4kTR_1} \times \left[\frac{R_2}{R_1} \right]$$
 = thermal noise of R_1

$$e_2 = \sqrt{4kTR_2}$$
 = thermal noise of R_2

Noise at the output:

$$E_o^2 = \left[1 + \frac{R_2}{R_1 + R_S} \right]^2 e_n^2 + e_1^2 + e_2^2 + (i_n R_2)^2 + e_s^2$$

Where $e_s = \sqrt{4kTR_S} \times \left[\frac{R_2}{R_1 + R_S} \right]$ = thermal noise of R_S

$$e_1 = \sqrt{4kTR_1} \times \left[\frac{R_2}{R_1 + R_S} \right]$$
 = thermal noise of R_1

$$e_2 = \sqrt{4kTR_2}$$
 = thermal noise of R_2

NOTE: For the SGM8261-1/2 operational amplifier at 1kHz, $e_n = 1.6nV/\sqrt{Hz}$ and $i_n = 6pA/\sqrt{Hz}$.

Figure 3. Noise Calculation in Gain Configurations

APPLICATION INFORMATION (continued)

Total Harmonic Distortion Measurements

The SGM8261-1/2 operational amplifiers have excellent distortion characteristics. THD + noise is below 0.00015% ($G = +1$, $V_{OUT} = 3V_{RMS}$, $BW = 80kHz$) throughout the audio frequency range, 20Hz to 20kHz, with a 2kΩ load.

The distortion produced by SGM8261-1/2 operational amplifiers is below the measurement limit of many commercially available distortion analyzers. However, a special test circuit (such as Figure 4 shows) can be used to extend the measurement capabilities.

Operational amplifier distortion can be considered an internal error source that can be referred to the input. Figure 4 shows a circuit that causes the operational amplifier distortion to be 101 times (or approximately 40dB) greater than that normally produced by the operational amplifier. The addition of R_3 to the otherwise standard non-inverting amplifier configuration alters the feedback factor or noise gain of the circuit. The closed-loop gain is unchanged, but the feedback available for error correction is reduced by a factor of 101, thus extending the resolution by 101. Note that the input signal and load applied to the operational amplifier are the same as with conventional feedback without R_3 . The value of R_3 should be kept small to minimize its effect on the distortion measurements.

Validity of this technique can be verified by duplicating measurements at high gain and/or high frequency where the distortion is within the measurement capability of the test equipment. Measurements for this datasheet were made with an Audio Precision System Two distortion/noise analyzer, which greatly simplifies such repetitive measurements. The measurement technique can, however, be performed with manual distortion measurement instruments.

Capacitive Loads

The dynamic characteristics of the SGM8261-1/2 have been optimized for commonly encountered gains, loads, and operating conditions. The combination of low closed-loop gain and high capacitive loads decreases the phase margin of the amplifier and can lead to gain peaking or oscillations. As a result, heavier capacitive loads must be isolated from the output. The simplest way to achieve this isolation is to add a small resistor (R_S equal to 50Ω, for example) in series with the output.

Power Dissipation

SGM8261-1/2 operational amplifiers are capable of driving 2kΩ loads with a power supply voltage up to ±18V. Internal power dissipation increases when operating at high supply voltages. Copper leadframe construction used in the SGM8261-1/2 operational amplifiers improves heat dissipation compared to conventional materials. Circuit board layout can also help minimize junction temperature rise. Wide copper traces help dissipate the heat by acting as an additional heat sink. Temperature rise can be further minimized by soldering the devices to the circuit board rather than using a socket.

Electrical Overstress

Designers often ask questions about the capability of an operational amplifier to withstand electrical overstress. These questions tend to focus on the device inputs, but may involve the supply voltage pins or even the output pin. Each of these different pin functions has electrical stress limits determined by the voltage breakdown characteristics of the particular semiconductor fabrication process and specific circuits connected to the pin. Additionally, internal electrostatic discharge (ESD) protection is built into these circuits to protect them from accidental ESD events both before and during product assembly.

Signal Gain = $1 + R_2/R_1$
Distortion Gain = $1 + R_2/(R_1||R_3)$

SIG. Gain	DIST. Gain	R ₁	R ₂	R ₃
1	101	∞	1kΩ	10Ω
-1	101	4.99kΩ	4.99kΩ	49.9Ω
+10	110	549Ω	4.99kΩ	49.9Ω

Figure 4. Distortion Test Circuit

APPLICATION CIRCUIT

Figure 5 shows how to use the SGM8261-1/2 as an amplifier for professional audio headphones. The circuit

shows the left side stereo channel. An identical circuit is used to drive the right side stereo channel.
