

SGM8967-1/SGM8967-2/SGM8967-4

2.7mA, 27MHz, High Precision, Rail-to-Rail I/O, Low Noise, CMOS Operational Amplifiers

GENERAL DESCRIPTION

The SGM8967-1/2/4 are a family of single, dual and quad rail-to-rail input and output operational amplifiers with 27MHz gain-bandwidth product and 30V/ μ s slew rate, while consuming only 2.7mA quiescent current per amplifier at 5.5V.

The SGM8967-1/2/4 feature a 240 μ V maximum input offset, and the devices are optimized for low voltage operation from 2.1V to 5.5V.

The single SGM8967-1 is available in Green SOT-23-5 and SOIC-8 packages. The dual SGM8967-2 is available in Green SOIC-8 and MSOP-8 packages. The quad SGM8967-4 is available in Green SOIC-14 and TSSOP-14 packages. They are specified over the extended industrial temperature range (-40°C to +125°C).

FEATURES

- Rail-to-Rail Input and Output
- Input Offset Voltage: 240 μ V (MAX)
- High Gain-Bandwidth Product: 27MHz
- High Slew Rate: 30V/ μ s
- Settling Time to 0.1% with 2V Step: 120ns
- Overload Recovery Time: 60ns
- Low Noise: 8nV/ $\sqrt{\text{Hz}}$ at 10kHz
- Supply Voltage Range: 2.1V to 5.5V
- Input Voltage Range: -0.1V to 5.6V with $V_S = 5.5V$
- Low Power:
 - Supply Current: 2.7mA/Amplifier (TYP)
- -40°C to +125°C Operating Temperature Range
- Small Packaging:
 - SGM8967-1 Available in Green SOT-23-5 and SOIC-8 Packages
 - SGM8967-2 Available in Green MSOP-8 and SOIC-8 Packages
 - SGM8967-4 Available in Green SOIC-14 and TSSOP-14 Packages

APPLICATIONS

Sensor
Audio
Active Filter
A/D Converter
Communication
Test Equipment
Cellular and Cordless Phone
Laptop and PDA
Photodiode Amplification
Battery-Powered Instrumentation

SGM8967-1 SGM8967-2/SGM8967-4

2.7mA, 27MHz, High Precision, Rail-to-Rail I/O, Low Noise, CMOS Operational Amplifiers

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

ABSOLUTE MAXIMUM RATINGS

Supply Voltage, +V_s to -V_s.....6V
 Input Common Mode Voltage Range
 (-V_s) - 0.3V to (+V_s) + 0.3V
 Junction Temperature+150°C
 Storage Temperature Range.....-65°C to +150°C
 Lead Temperature (Soldering, 10s)+260°C
 ESD Susceptibility
 HBM (SGM8967-1/2)..... 7000V
 HBM (SGM8967-4)..... 6000V
 CDM 1000V

RECOMMENDED OPERATING CONDITIONS

Operating Temperature Range-40°C to +125°C

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods

may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

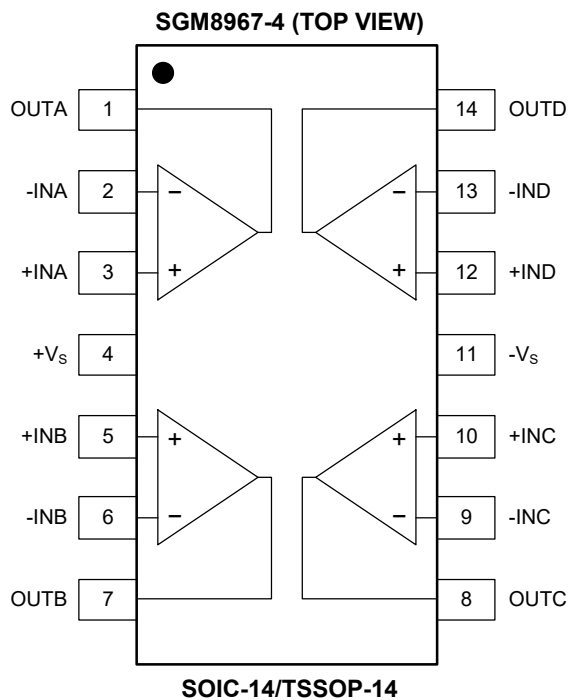

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

APPLICATION NOTES

Rail-to-Rail Input

The input common mode voltage range of the SGM8967-1/2/4 extends 100mV beyond the supply rails for the full supply voltage range of 2.1V to 5.5V. Diodes between the inputs and the supply rails keep the input voltage from exceeding the rails.

Figure 1. Equivalent Input Circuit

Input Protection

The SGM8967-1/2/4 family incorporates internal ESD protection circuits on all pins. For input and output pins, this protection primarily consists of current-steering diodes connected between the input and power supply pins. Therefore, as well as keeping the input voltage below the maximum rating, it is also important to limit the input current to less than 10mA. Figure 2 shows how a series input resistor can be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the value must be kept to a minimum in noise-sensitive applications.

Figure 2. Input Current Protection

Rail-to-Rail Output

The minimum output voltage will be within millivolts of ground for single-supply operation where the load is referenced to ground ($-V_S$). With a 5.5V supply and the 10kΩ load tied to ground, the typical output swings from 0.008V to 5.492V.

Driving Capacitive Loads

The SGM8967-1/2/4 are unity-gain stable for capacitive load up to 470pF. Applications that require greater capacitive drive capability should use an isolation resistor between the output and the capacitive load (Figure 3). Note that this alternative results in a loss of gain accuracy because R_{ISO} forms a voltage divider with the R_{LOAD} .

Figure 3. Using Isolation Resistor to Improve Stability when Driving Heavy Capacitive Load

Power Supply Bypassing and Layout

Power supply pins are actually inputs to the amplifiers. Care must be taken to provide the amplifiers with a clean, low noise DC voltage source.

Power supply bypassing is employed to provide a low impedance path to ground for noise and undesired signals at all frequencies. This cannot be achieved with a single capacitor type; but with a variety of capacitors in parallel, the bandwidth of power supply bypassing can be greatly extended. The bypass capacitors have two functions:

1. Provide a low impedance path for noise and undesired signals from the supply pins to ground.
2. Provide local stored charge for fast switching conditions and minimize the voltage drop at the supply pins during transients. This is typically achieved with large electrolytic capacitors.

APPLICATION NOTES (continued)

Good quality ceramic chip capacitors should be used and always kept as close as possible to the amplifier package. A parallel combination of a 0.1 μ F ceramic and a 10 μ F electrolytic covers a wide range of rejection for unwanted noise. The 10 μ F capacitor is less critical for high frequency bypassing, and in most cases, one per supply line is sufficient. The values of capacitors are circuit-dependent and should be determined by the system's requirements.

Figure 4. Amplifier with Bypass Capacitors

Grounding

Separate grounding for analog and digital portions of circuitry is one of the simplest and most effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes.

A ground plane helps distribute heat and reduces EMI noise pickup. Make sure to physically separate digital and analog grounds, paying attention to the flow of the ground current.

Input-to-Output Coupling

To minimize capacitive coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace perpendicular is much better as opposed to in parallel with the noisy trace. This helps reduce unwanted positive feedback.

TYPICAL APPLICATION CIRCUITS

Difference Amplifier

The circuit shown in Figure 5 performs the difference function. If the resistor ratios are equal ($R_4/R_3 = R_2/R_1$), then $V_{OUT} = (V_P - V_N) \times R_2/R_1 + V_{REF}$.

Figure 5. Difference Amplifier

High Input Impedance Difference Amplifier

The circuit in Figure 6 performs the same function as that in Figure 5 but with a high input impedance.

Figure 6. High Input Impedance Difference Amplifier

Active Low-Pass Filter

The low-pass filter shown in Figure 7 has a DC gain of $(-R_2/R_1)$ and the -3dB corner frequency is $1/2\pi R_2 C$. Make sure the filter bandwidth is within the bandwidth of the amplifier. Feedback resistors with large values can couple with parasitic capacitance and cause undesired effects such as ringing or oscillation in high-speed amplifiers. Keep resistor values as low as possible and consistent with output loading consideration.
