

**GENERAL DESCRIPTION**

The SP809 is a low power microprocessor ( $\mu\text{P}$ ) supervisory circuit used to monitor power supplies in  $\mu\text{P}$  and digital systems.

It provides applications with benefits of circuit reliability and low cost by eliminating external components. If the  $V_{CC}$  supply voltage falls below preset threshold then a reset signal is asserted for at least 140ms after  $V_{CC}$  has risen above the reset threshold.

The SP809 was designed with a reset comparator to help identify invalid signals, which last less than 140ms. Low supply current ( $1\mu\text{A}$ ) makes SP809 ideal for portable equipment.

The SP809 is available in a 3 pin SOT-23 package.

**APPLICATIONS**

- **Portable Electronic Devices**
- **Electrical Power Meters**
- **Digital Still Cameras**
- **$\mu\text{P}$  Power Monitoring**

**FEATURES**

- **Ultra Low Supply Current  $1\mu\text{A}$  (typ)**
- **Guaranteed Reset valid to  $V_{CC} = 0.9\text{V}$**
- **140ms Power-On Reset Pulse Width**
- **Internally Fixed Threshold  $2.3\text{V}, 2.6\text{V}, 2.9\text{V}, 3.1\text{V}, 4.4\text{V}, 4.6\text{V}$**
- **1.5% Voltage Threshold Tolerance**
- **3 Pin SOT-23 Package**

Part Number	Output Type
SP809N	Open Drain Active Low
SP809	Push-Pull Low

**TYPICAL APPLICATION DIAGRAM**

**ABSOLUTE MAXIMUM RATINGS**

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

V<sub>CC</sub>..... -0.3V to 6.5V  
 RESET,  $\overline{\text{RESET}}$ ..... -0.3V to V<sub>CC</sub>+0.3V  
 Output Current ( $\overline{\text{RESET}}$ ) ..... 20mA  
 Power Dissipation (T<sub>A</sub>=70°C) ..... 320mW  
 Junction Temperature ..... 125°C  
 Storage Temperature.....-65°C to 150°C

**OPERATING RATINGS**

Input Voltage Range V<sub>CC</sub>..... 0.9V to 6V  
 Junction Temperature Range ..... -40°C to 85°C

**ELECTRICAL SPECIFICATIONS**

Specifications with standard type are for an Operating Temperature of T<sub>A</sub> = 25°C only; limits applying over the full Operating Temperature range are denoted by a “•”. Minimum and Maximum limits are guaranteed through test, design, or statistical correlation. Typical values represent the most likely parametric norm at T<sub>A</sub> = 25°C, and are provided for reference purposes only. Unless otherwise indicated, T<sub>A</sub>= 25°C.

Parameter	Min.	Typ.	Max.	Units	Conditions
Operating Voltage Range V <sub>CC</sub>	0.9		6.0	V	
Supply Current I <sub>CC</sub>		1.0	3.0	μA	V <sub>CC</sub> =V <sub>TH</sub> +0.1V
Reset Threshold V <sub>TH</sub>	2.265	2.3	2.335	V	T <sub>A</sub> =+25°C
	2.254		2.346		• T <sub>A</sub> =-40°C to 85°C
	2.561	2.6	2.639		T <sub>A</sub> =+25°C
	2.548		2.652		• T <sub>A</sub> =-40°C to 85°C
	2.857	2.9	2.944		T <sub>A</sub> =+25°C
	2.842		2.958		• T <sub>A</sub> =-40°C to 85°C
	3.054	3.1	3.147		T <sub>A</sub> =+25°C
	3.038		3.162		• T <sub>A</sub> =-40°C to 85°C
	4.334	4.4	4.466		T <sub>A</sub> =+25°C
	4.312		4.488		• T <sub>A</sub> =-40°C to 85°C
	4.531	4.6	4.669		T <sub>A</sub> =+25°C
	4.508		4.692		• T <sub>A</sub> =-40°C to 85°C
V <sub>CC</sub> Reset Delay t <sub>TRIP</sub>		20		μs	V <sub>CC</sub> =V <sub>TH</sub> to (V <sub>TH</sub> - 0.1V), V <sub>TH</sub> =3.1V
Reset Active Timeout Period t <sub>RP</sub>	140	230	560	ms	T <sub>A</sub> =+25°C
	100		1030		• T <sub>A</sub> =-40°C to 85°C
$\overline{\text{RESET}}$ Output Voltage V <sub>OH</sub>	0.8V <sub>CC</sub>				V <sub>CC</sub> =V <sub>TH</sub> + 0.1V, I <sub>SOURCE</sub> = 1.2mA
$\overline{\text{RESET}}$ Output Voltage V <sub>OL</sub>			0.3	V	V <sub>CC</sub> =V <sub>TH</sub> - 0.1V, I <sub>SINK</sub> = 1.2mA

**THEORY OF OPERATION**

$\mu$ P will be activated at a valid reset state. These  $\mu$ P supervisory circuits assert reset to prevent code execution errors during power-up, power-down, or brownout conditions.

Reset is guaranteed to be a logic low for  $V_{TH} > V_{CC} > 0.9V$ . Once  $V_{CC}$  exceeded the reset threshold, an internal timer keeps  $\overline{RESET}$  low for the reset timeout period; after this interval,  $\overline{RESET}$  goes high.

If a brownout condition occurs ( $V_{CC}$  drops below the reset threshold),  $\overline{RESET}$  goes low. Any time  $V_{CC}$  goes below the reset threshold, the internal timer resets to zero, and  $\overline{RESET}$  goes low. The internal timer is activated after  $V_{CC}$  returns above the reset threshold, and  $\overline{RESET}$  remains low for the reset timeout period.

**BENEFIT OF HIGHLY ACCURATE RESET THRESHOLD**

SP809 with specified voltage as  $5V \pm 10\%$  or  $3V \pm 10\%$  are ideal for systems using a  $5V \pm 5\%$

**APPLICATION INFORMATION**

**NEGATIVE GOING  $V_{CC}$  TRANSIENTS**

In addition to issuing a reset to the  $\mu$ P during power-up, power-down, and brownout conditions, SP809 series are relatively resistant to short-duration negative-going  $V_{CC}$  transient.

**ENSURING A VALID RESET OUTPUT DOWN TO  $V_{CC}=0$**

When  $V_{CC}$  falls below 0.9V, SP809  $\overline{RESET}$  output no longer sinks current; it becomes an open circuit. In this case, high-impedance CMOS logic inputs connecting to  $\overline{RESET}$  can drift to undetermined voltages. Therefore, SP809 with CMOS is perfect for most applications of  $V_{CC}$  down to 0.9V.

However in applications where  $\overline{RESET}$  must be valid down to 0V, adding a pull-down resistor to  $\overline{RESET}$  causes any leakage currents to flow to ground, holding  $\overline{RESET}$  low.

or  $3V \pm 5\%$  power supply. The reset is guaranteed to assert after the power supply falls below the minimum specified operating voltage range of the system ICs. The pre-trimmed thresholds are reducing the range over which an undesirable reset may occur.

Fig. 10: Timing Waveforms

**INTERFACING TO  $\mu$ P WITH BIDIRECTIONAL RESET PINS**

The  $\overline{RESET}$  output on the SP809N is open drain, this device interfaces easily with  $\mu$ Ps that have bidirectional reset pins. Connecting the  $\mu$ P supervisor's  $\overline{RESET}$  output directly to the microcontroller's RESET pin with a single pull-up resistor allows either device to assert reset.
