GENERAL DESCRIPTION

The TMI6810 series device are low I_q supply voltage supervisory that monitors a single voltage used in microprocessor and digital control system. The TMI6810 provide an active high reset signal while the VCC supply voltage drops below the reset threshold voltage. When the VCC supply voltage rises above the threshold voltage plus hysteresis the reset output goes low after 240ms (typical) reset delay time.

TMI6810 series are available suitable for monitoring 3V, 3.3V and 5V supply voltages. The low supply current of typical $5\mu A$ makes TMI6810 series devices ideal for using in portable, battery powered system applications, and they are available in 3-pin SOT23-3 package.
